

Installing AIP4WIN V2 on a Windows 10 Machine

AIP4WIN V2 can sometimes have issues when being installed under Windows 10. Please note the following instructions:

- 1) Download the latest version of the software (AIP4WIN 2.4.10) from the class website.
- 2) Extract the files from the zip files. DO NOT attempt to install the program from the zip file itself.
- 3) Right click on the installation file (the AIP4WinSetup.exe file), and it as administrator.

If you have further issues:

- 4) When starting the program: right click on the program and say to trouble shoot compatibility and say that it worked in a previous version (XP Service Pack 3, or sometimes Windows 8) and that it needs to launch with Administrator privileges.
- 5) If you have an error with the mscomctl.ocx file, follow the instructions at <https://www.urtech.ca/2017/11/> to properly register the mscomctl.ocx file.
- 6) There is an AIP4WIN group that may be off help for other issues: <https://groups.io/g/AIP4Win/>
